CareLoop AI: Enhanced Plan (Rubric-Aligned)

Missed appointment se confirmed follow-up tak ek closed-loop system. Agentika 2.0 handbook ke rubric (page 13) ke mutabiq tayyar kiya gaya plan. Domain: healthcare operations. Platform: fastn MCP + Alternate Clouds.

1. Core idea (ek paragraph)

CareLoop ek chatbot nahi, ek **recovery engine** hai. Ye missed appointments ko detect karta hai, patient ko personalized follow-up bhejta hai, reply ke mutabiq next step chunta hai, slot dobara verify karke booking confirm karta hai, aur jo case resolve na ho use clinic staff ko poori history ke saath handover karta hai. AI repetitive administrative kaam sambhalta hai. Clinical faisla hamesha insaan ka hai.

2. Teen focused agents (6 se kam karke scope realistic kiya)

Agent	Zimmedari	fastn MCP tools (verify karne hain)
Recovery Monitor	Appointment records padhna, missed visits dhoondhna, duplicate follow-up rokna, next step decide karna (message / reschedule / escalate).	Appointment read tool
Outreach Agent	Personalized reminder draft karna aur 2-3 slot options likhna. Sirf staff approval ke baad bhejna.	Messaging tool (send only after approval)
Scheduling Agent	Booking se pehle slot revalidate karna, booking record karna, status update karna. Conflict ho to naya option dena.	Calendar / booking read and write tools

Har agent ka kaam chhota aur testable hai. Inka faisla ek **decision policy** se hota hai (neeche section 5), taake AI ka behaviour predictable rahe. fastn MCP sirf woh tools deta hai jin ko agent **find_tools** se dhoondhta hai aur **execute_tool** se chalata hai.

3. Appointment ki life cycle (state machine)

Har appointment ek state mein hota hai. Ye state machine judges ko demo mein dikhane ka sab se strong proof hai, kyun ke har transition logged hota hai.

Current state	Trigger	Next state
scheduled	Visit time guzar gaya aur patient nahi aaya	missed
missed	Follow-up draft bana aur staff ne approve kiya	follow_up_pending
follow_up_pending	Patient ne slot chuna	slot_verifying
follow_up_pending	Patient ne clinical sawal poocha	escalated (staff ko flag)
follow_up_pending	3 attempts ke baad koi reply nahi	escalated (staff ko flag)
slot_verifying	Slot ab bhi available hai	rescheduled (confirmed)
slot_verifying	Slot ab busy hai	follow_up_pending (naya option offer)

4. Rubric ke six criteria: kya banana hai aur kya dikhana hai

A. Technical execution and reliability (25 points)

- **End-to-end flow:** Monitor se Scheduling tak ek poora run live chale. Yeh demo ka base hai.
- **Duplicate prevention:** Har missed appointment ka ek unique key ho. Agar follow-up pehle se bhej diya gaya ho, to dobara nahi jayega.

- **Failed message handling:** Agar message send na ho, to retry (2 baar) ke baad case escalate ho, khamosh fail na ho.
- **Slot revalidation:** Booking se pehle slot dobara check ho. Race condition ke liye ek simple lock ya re-check kafi hai.
- **Audit log:** Har action (kis agent ne kya kiya, kab, kis state se kis state mein gaya) ek table mein save ho.

B. Real-world impact (20 points)

- Dashboard par numbers dikhayein: missed visits, recovered visits, escalated cases, avg. time to resolution.
- Pilot ke liye 30 **synthetic** appointments use karein (koi real patient data nahi). Ek before/after comparison dikhayein: manual staff time vs CareLoop.
- Ek simple claim jo verify ho sake: "30 mein se X cases automatically close hue, Y staff ko escalate hue." Judges ko numbers pasand hote hain.

C. Human + AI alignment (15 points)

- **Approval gate:** Har outgoing patient message staff ki approval ke baghair nahi jata. Staff edit ya reject bhi kar sake.
- **AI ki boundaries likh kar dikhayein:** AI diagnosis nahi karta, dawa nahi batata, clinical treatment ka faisla nahi karta.
- **Escalation triggers:** clinical keywords, 3 failed attempts, slot conflict, ya patient ki angry/urgent reply. In sab par case seedha staff ke queue mein jaye.
- Demo ka hero moment: staff ek message ko edit karke approve kare. Judges ko dikhe ke human control asli hai.

D. Creativity and uniqueness (15 points)

- Positioning: "chatbot nahi, recovery system." Bahut se projects patient ke sawalon ka jawab dete hain. CareLoop lost appointment ko wapas kholta hai.
- Decision policy visible ho: "agar patient ne 2 din mein reply nahi kiya, to dusra option; agar 3 attempts fail, to staff."

E. Automation depth and MCP (15 points)

- Teen agents ka clear handoff: Monitor → Outreach → (approval) → Scheduling → Closure.
- Tool-call trace dashboard par dikhayein: kaun sa agent kaun sa fastn tool chala aur result kya tha.
- Verify karein ke kaun se connectors aapke account mein available hain, pehle se hi. Agar koi connector na chale, to fallback: mock data source se same flow dikhayein aur ye honestly bataein.

F. User experience and presentation (10 points)

- Ek hi dashboard screen, 4 columns: **Missed** | **Proposed action** | **Pending approval** | **Closed / Escalated**.
- Har card par ek chhoti activity line: "Reminder draft ban gaya, staff approval ka intezar."
- Koi extra screen nahi. Clean UI, bade numbers, aur ek live feed.

5. Decision policy (AI kya kar sakta hai, kya nahi)

Situation	AI ka faisla	Human kya karega
Pehli baar missed	Reminder draft karo, 2 slots suggest karo	Approve, edit ya reject

Situation	AI ka faisla	Human kya karega
Patient ne slot chuna	Slot revalidate karke book karo	Kuch nahi, sirf confirmation dekhna
Slot ab busy	Naya option offer karo, conflicting booking mat banao	Approve naya message
Patient ne clinical sawal poocha	Jawab mat do, sirf flag karo	Staff khud reply karega
3 attempts ke baad reply nahi	Case escalate karo	Staff call ya follow-up plan
Message send fail	2 baar retry, phir escalate	Technical issue ya contact check

6. Demo script (6 minute, judges ke saamne)

Time	Kya dikhana hai	Kis criterion ko cover karta hai
0:00-0:45	Problem: 30 appointments, kuch missed, manual kaam. Solution ek line mein.	Real-world impact
0:45-2:15	Scenario A: missed visit detect, reminder draft, staff approve, patient slot chunta hai, booking confirm. Action history dikhayein.	Technical execution, Automation and MCP
2:15-3:30	Scenario B: patient clinical sawal poochta hai. AI jawab nahi deta, staff ko flag karta hai. Slot conflict wala case bhi dikhayein.	Human + AI alignment
3:30-4:30	Dashboard: numbers, tool-call trace, audit log ka ek hissa.	UX, Real-world impact
4:30-5:30	Deployment: Alternate Clouds par live link. Test account se login.	Technical execution (rule 02)
5:30-6:00	Creativity ka ek line: "ye chatbot nahi, recovery system hai." Sawal ka jawab.	Creativity

Rehearse karein: demo 6 minute se kam ho taake sawal ke liye time bache. Scenario B ko zyada time dein.

7. Score ka self-assessment (honest)

Criterion	Weight	Kya ho to achha score	Abhi ka risk
Technical execution	25	Happy path + failure case + duplicate check working	Medium: integration check zaroori
Real-world impact	20	Numbers dashboard par, synthetic pilot ke saath	Low: data banana asaan
Human + AI alignment	15	Approval live, boundaries likhi hui	Low
Creativity	15	Positioning clear, policy visible	Low
Automation and MCP	15	3 agents, tool trace visible	High: fastn ka exact flow verify karna
UX and presentation	10	Ek dashboard, clean, live feed	Medium: time ki kami

8. Risks aur fallback (aaj ke liye)

Risk	Fallback
fastn connector kaam na kare	Mock appointment source se flow dikhayein, aur judges ko honestly bataein. Technical support se rabta karein.
Alternate Clouds deploy fail	Pehle chhota test deploy. Error capture karke technical support ko dikhayein. Local-only demo qualify nahi karta, is liye ye priority hai.
Time kam pad jaye	Scenario B ko chhod kar sirf escalation flag dikhayein. Dashboard ko static table bana dein.
Demo mein sawal ka jawab nahi	Model ki limitation bataein: 'ye pilot hai, real clinic data par validation next step hai.'

9. Submission ke liye checklist (handbook pages 9-11)

- **Section 1 (Team):** team name, dono members ke full names, emails, Discord usernames, ek WhatsApp number.
- **Section 2 (Project):** project name, one-line pitch, problem aur kis ke liye (2-3 lines), human kahan involved hai (Theme: Human + AI: Better Together), kya build kiya (n8n ya custom code, plus AI models, APIs, MCP).
- **Section 3 (Links):** live Alternate Clouds link (closing tak chalta rahe), GitHub repo ya n8n JSON, 2-3 min demo video (unlisted), LinkedIn post aur teammate ka reshare link.
- **Section 4 (Proof):** Discord screenshot (dono members), Alternate Clouds dashboard screenshot jisme service aur deployment status ho.
- **Section 5 (Confirm):** LinkedIn post khud likha gaya, deployment hai, koi API key ya production password nahi, third-party code credit hai, 12:45 PM ke baad koi change nahi.
- Judges ke liye demo test account, koi personal password nahi.

10. Ek line mein

CareLoop AI missed appointments ko detect karta hai, personalized follow-up bhejta hai, staff ki approval leta hai, slot verify karke booking confirm karta hai, aur jahan insaan ki zaroorat ho wahan case staff ko handover karta hai.
